Comprehension 1 (8 marks)
Read the passage carefully and answer the questions that follow.

Lisa always envied her friends who whizzed by on their bicycles confidently, their laughter trailing behind them. At nine years old, she decided it was time to conquer her fear and learn to ride too. As soon as she awoke, Lisa marched to the storeroom where her old bicycle stood, its tyres flat and spokes rusty from lack of use. She dragged it into the sunlight. Her father appeared; a smile formed on his lips as he knelt to inspect the bicycle.

"Let's get this bicycle ready," he said, his voice full of encouragement.

For hours, they worked together. Lisa learned about tyre pressure and balance, how to grasp the handlebars with confidence, and when to push off. Time and again, she wobbled and fell, scraping her knees and bruising her pride. However, each tumble was a lesson learned, a step closer to mastering the art of riding. Finally, as evening came, Lisa pushed off one last time. With her father's hand gently on her back, she felt the magic of balance and momentum, the feeling of independence coursing through her veins.

That evening, Lisa returned home dusty, injured, but victorious. Her heart swelled with pride as she hugged her bicycle, now a **trusted companion** in her adventures yet to come.

Comprehension 2 (10 marks)

Read the passage carefully and answer the questions that follow.

Honeybees live in colonies with one queen running the whole hive. Worker honeybees are all females and are the only bees most people ever see flying around outside of the hive. They forage for food, build the honeycombs and protect the hive.

Many species of honeybees are disappearing from hives due to Colony Collapse Disorder. This is a situation when the majority of the worker bees in a colony disappear, leaving behind their queen. Scientists are not sure what is causing this collapse.

Honeybees are important pollinators for flowers, fruits, and vegetables. **They** live on stored honey and pollen all winter and cluster into a ball to conserve warmth. All honeybees are social and cooperative insects. Members of the hive are divided into three types. Workers forage for nutrients, build and protect the hive, as well as clean and circulate the air by beating their wings.

The queen's job is simple—she lays the eggs that will produce the hive's next generation of bees. There is usually only a single queen in a hive. If the queen dies, workers will create a new queen by feeding one of the female worker bees a special food called 'royal jelly'. This enables the bee to develop into a fertile queen.

Male bees are called drones—the third type of honeybee. Several hundred drones live in each hive, fed by the female worker bees only during spring and summer. However, during the winter months, unable to feed themselves, drones **quickly die**.
